

PHASE1

Ideation and Brainstorming

Implement Client Script & UI Policy (Incident)

Projectconcept,problemdefinition,empathymap,andoverallprojectmapping

Date	30/09/2026
Team Id	6ab4ddb0fc666a751b566e9
Project Name	Implement Client Script &UI Policy(Incident)

1.1 Introduction

Ideation and Brainstorming is the initial phase used to understand the project concept, identify the problem, define the proposed direction, and organize the overall project idea. For this project, the focus is on improving Incident Management in ServiceNow through UI Policies and Client Scripts.

1.2 Brainstorming

Project Overview

The project focuses on implementing Client Scripts and UI Policies in ServiceNow Incident Management to improve data accuracy and consistency. It aims to automate field behavior, enforce mandatory fields, validate user input, and prevent incorrect data submission.

Ideology of the Project

Concept	Project Idea
Data Integrity	Ensure Incident records contain accurate and complete information.
Automation	Automatically set Urgency to High when Impact is High.
Field Validation	Prevent submission of High Impact incidents when Assigned To is empty.
Dynamic Field Control	Make fields mandatory or read-only based on specific conditions.
Controlled Editing	Restrict direct Incident State changes through list editing.

Development of the Project

The project is developed on the ServiceNow platform using the Incident table, UI Policies, UI Policy Actions, and three Client Script types: onChange, onSubmit, and onCellEdit. The configuration is then verified through functional tests covering High Impact behavior, submission validation, reverse conditions, and list editing restrictions.

1.3 Define Problem Statement

Problem of the Project

- High Impact incidents may be created without sufficient assignment information.
- Users may choose an Urgency value that is inconsistent with a High Impact Incident.
- Incomplete Incident records may be submitted without save-time validation.
- Users may modify Incident State directly through list editing.
- Manual checks can result in inconsistent data entry.

Proposed Solution

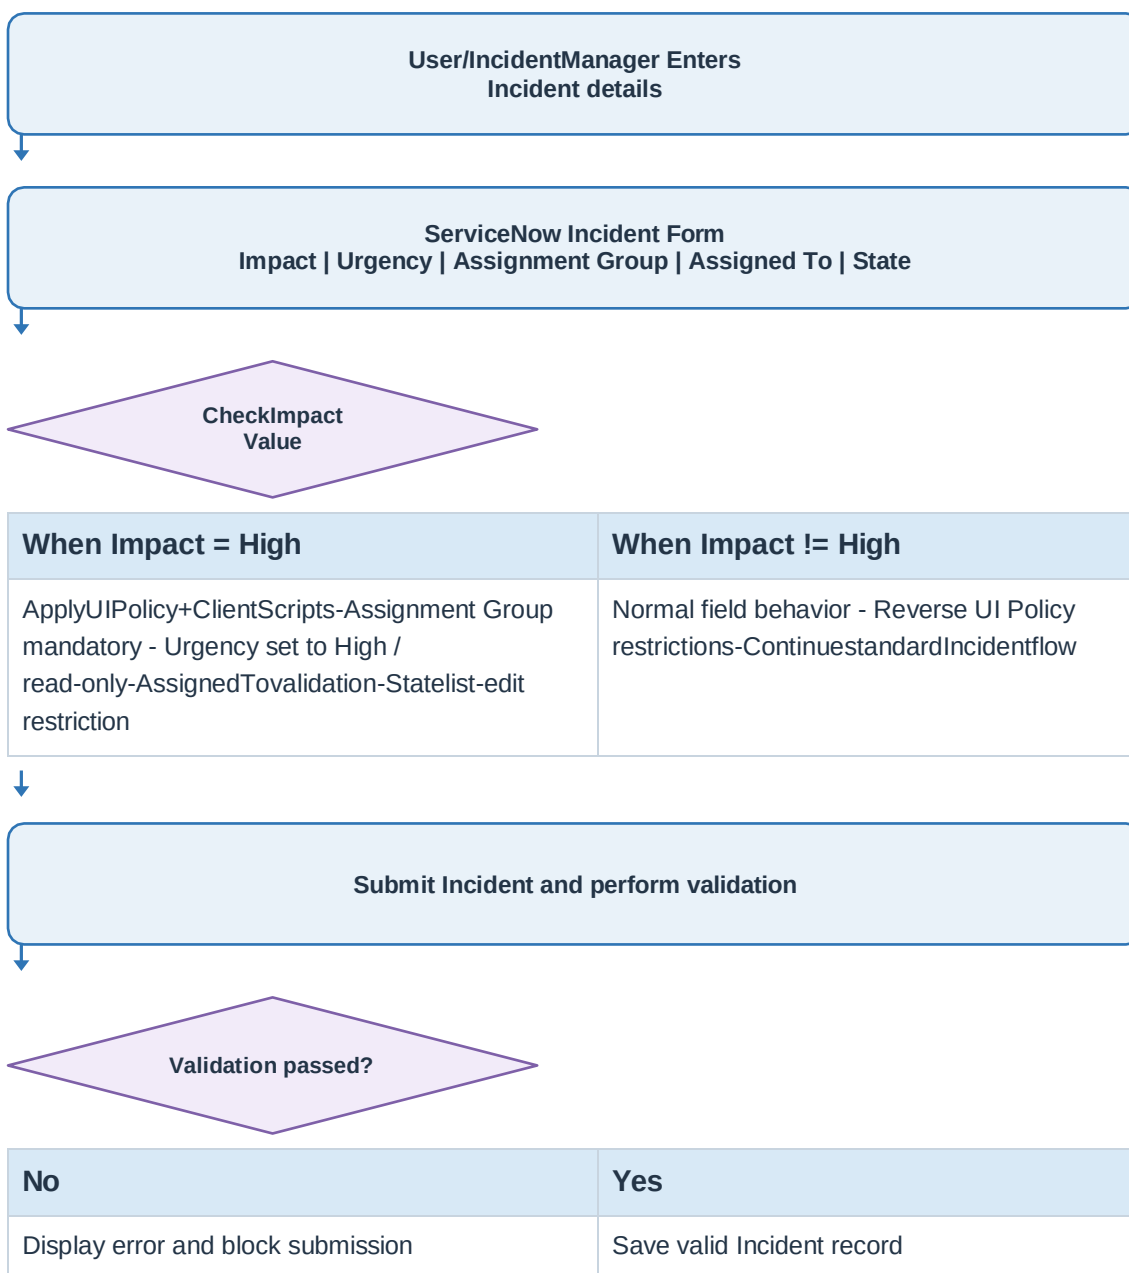

The proposed solution is to implement UI Policies and Client Scripts in ServiceNow to enforce conditional field behavior and validate Incident information. A High Impact Control UI Policy controls Assignment Group and Urgency. An onChange Client Script automates Urgency, an onSubmit Client Script validates Assigned To, and an onCellEdit Client Script blocks direct State changes from list editing.

1.4 Empathy Map

The empathy map represents the perspective of a typical ServiceNow Incident Management user. It is a proposed user perspective based on the project problem statement, not the result of actual interviews.

Empathy Area	Project-Oriented User Perspective
Says / Thinks	I need to create Incident records correctly and avoid missing important fields.
Does	Creates, assigns, updates, and submits Incident records.
Pain Points	Missing assignments, incorrect Urgency, incomplete submissions, and uncontrolled list editing.
Gains	Automatic field updates, clear validation, accurate records, and controlled editing.

1.5 Overall Project Map

1.6 Conclusion

The Ideation and Brainstorming phase identifies the challenges associated with Incident data entry and defines a solution using ServiceNow UI Policies and Client Scripts. It establishes the concept and user-oriented problem foundation for the subsequent requirement analysis and system design phases.
