

PHASE2

Requirement Analysis

Implement Client Script & UI Policy (Incident)

Dataflow,customerjourney,solutionrequirements,andtechnicalsteps

Date	30/09/2026
Team ID	6ab4ddbf0fc666a751b566e9
Project Name	Implement Client Script & UI Policy(Incident)

2.1 Introduction

Requirement Analysis identifies what the proposed system must do, how the user interacts with it, what problems must be solved, and which technical components are needed. This phase is organized into Data Flow Diagram, Customer Journey, Solution Requirement, and Technical Steps.

2.2 Data Flow Diagram (DFD)

2.2.1 Project Flow

The project begins when a user enters Incident information in the ServiceNow Incident form. The system checks the Impact value and applies the configured UI Policy and Client Script behavior. Validated information is saved as an Incident record; invalid information results in a validation message and the save is blocked.

2.2.2 Execution Flow

- The user opens the Incident form and enters details.
- When Impact is High, the UI Policy and the onChange Client Script control the relevant fields.
- The onSubmit Client Script checks Assigned To before saving a High Impact Incident.

- The onCellEdit Client Script blocks direct State changes from list editing.
- When Impact changes away from High, Reverse if false restores the UI Policy behavior.

2.3 Customer Journey

CustomerJourneyexplainshowtheServiceDeskAgentorIncidentManagementuserusesthe developed functionality in practice.

Journey Stage	User Action	System Response
Access	LogsinandopensIncident Management.	Incident module becomes available.
Create	Enters Incident details.	Fields respond to the current Impact.
High Impact	Selects High for Impact.	AssignmentGroupbecomesmandatory; UrgencyisautomaticallysettoHighand becomes read-only.
Validate	Attempts to submit.	Assigned To is checked for High Impact.
Complete	Completes required assignment data.	Incidentcanbesaved,subjecttoother validations.
Update	Changes Incident State.	Listeditisblocked;form-basedchange can be used.

2.4 Solution Requirement

2.4.1 Problem to be Solved

Identified Problem	Required Response
Missing assignment information	ConditionalmandatoryenforcementforAssignment Group and save-time validation for Assigned To.
Incorrect Urgency	Automatic Urgency update when Impact is High.
Uncontrolled Urgency editing	Read-only control when Impact is High.
Direct State list editing	BlockonCellEditchangesandrequireform-based update.
Inconsistent behavior after condition changes	Use Reverse if false for UI Policy restoration.

2.4.2 Expected Solution

TherequiredsolutioncombinesUIPolicycontrols,UIPolicyActions,andClientScriptssothattheIncidentform can react to Impact, validate submission, and restrict specified list editing behavior.

2.5 Technical Steps

TheprojectusestheServiceNowplatform,IncidentManagement,UIPolicies,UIPolicyActions,JavaScriptClient Scripts,andawebbrowser.TheimplementationstepsaretocreatetheUIPolicy,configureitsactions,createthe onChange and onSubmit scripts, create the onCellEdit script, and then test the integrated behavior.

Tool / Component	Purpose
ServiceNow Platform	Development and configuration environment.
Incident Management	Incident creation, assignment, tracking, and update.
UI Policy	Conditional field behavior.
UI Policy Actions	Mandatory and read-only field controls.
JavaScript Client Scripts	Automatic updates, submission validation, and list editing control.
Web Browser	Accessing the ServiceNow instance and performing configuration and tests.

2.6 Conclusion

Requirement Analysis translates the project idea into a clear workflow, user journey, solution requirements set, and technical implementation path. These requirements form the foundation for Project Designing.
