

PHASE3

Project Designing

Implement Client Script & UI Policy (Incident)

Proposed solution, solution design, architecture, and design flow

Date	30/09/2026
Team ID	6ab4ddb0fc666a751b566e9
Project Name	Implement Client Script & UI Policy(Incident)

Introduction

Project Designing defines how the proposed ServiceNow solution will be structured before implementation. It convertstherequirementsintoapacticalconfigurationdesignandestablishestheinteractionbetweenUIPolicies and Client Scripts.

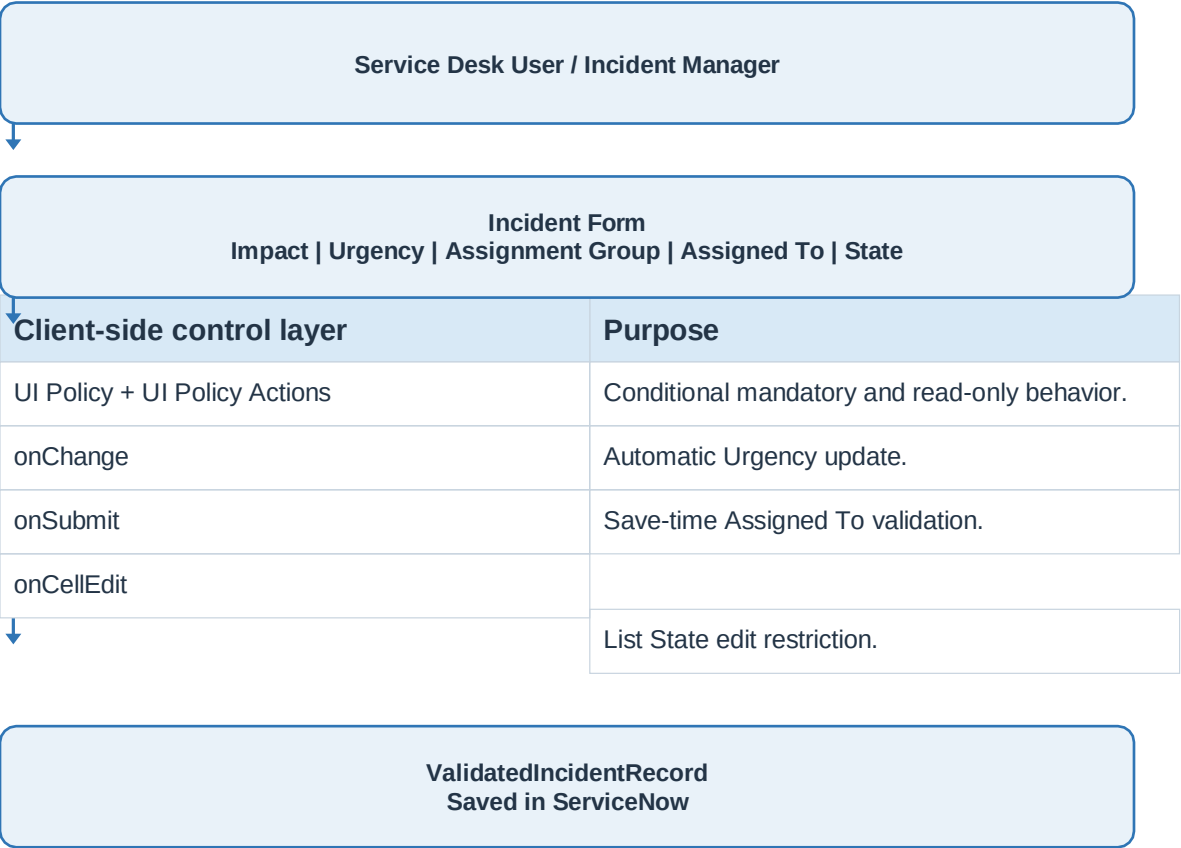

Proposed Solution

Theproposedsolutionisacient-sideIncidentcontrolsystemusingoneUIPolicyandthreeClientScripttypes. The design activates stronger controls for High Impact Incidents while restoring normal behavior when the condition is no longer true.

Component	Designed Behavior
High Impact Control UI Policy	Trigger when Impact is High; Reverse if false enabled.
Assignment Group action	Mandatory when policy condition is true.
Urgency action	Read-only when policy condition is true.
onChange Client Script	Set Urgency to High when Impact changes to High.
onSubmit Client Script	Block High Impact submission when Assigned To is empty.
onCellEdit Client Script	Block direct State changes through list editing.

Solution Designing

System Architecture

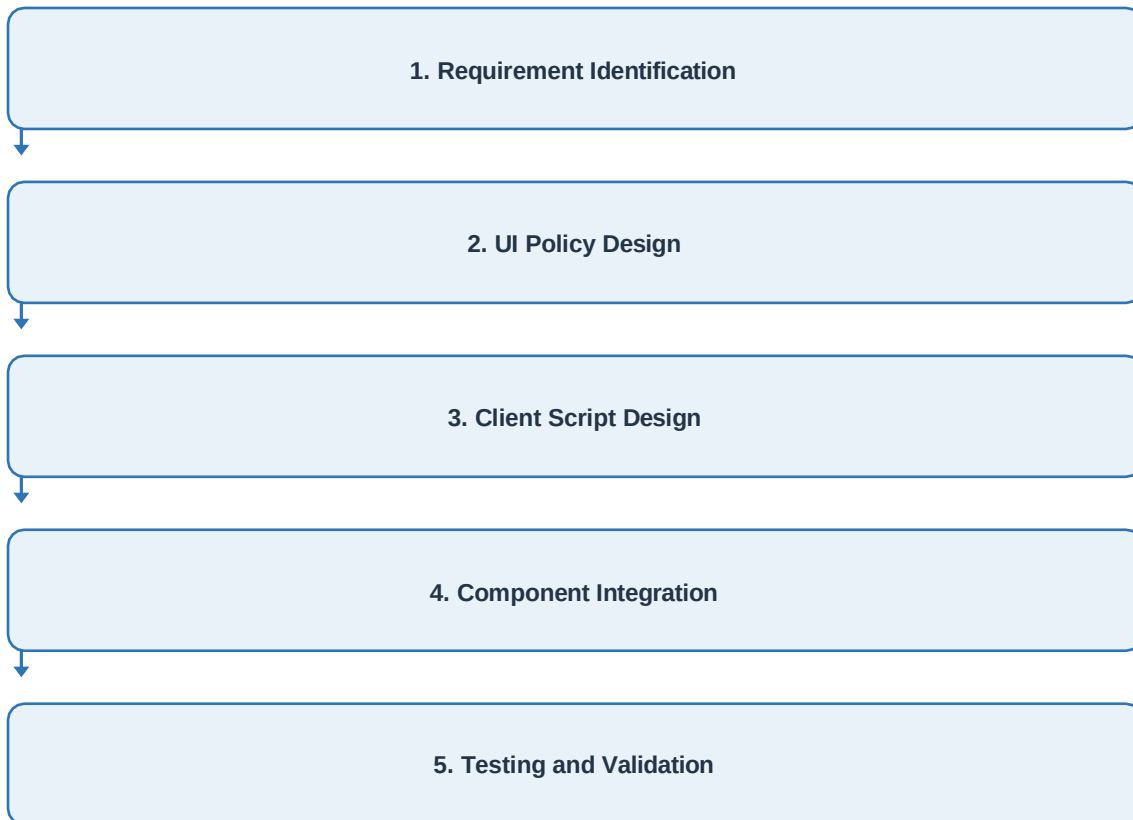

Module Design

Module	Design Description
UI Policy Design	HighImpactControlisappliedtotheIncidenttablewithImpact=High and Reverse if false enabled.
Automatic Urgency	onChange watches Impact and sets Urgency to High.
Form Validation	onSubmitchecksAssignedToforHighImpactandblocksinvalid submission.
List Editing Control	onCellEdit blocks direct State changes from the Incident list.
Testing Design	Verify field behavior, validation, reverse conditions, and list editing.

Flow of Designing

The design flow begins with finalized requirements and continues through component definition, integration planning, and test planning.

Expected Design Outcome

The expected design outcome is a structured Incident solution in which field controls, automatic updates, save-time validation, and list editing restrictions are clearly defined before development.

Conclusion

The Project Designing phase provides the blueprint for implementation. It defines the proposed solution, the system architecture, the modules, and the design flows so that development can proceed in a controlled sequence.
