Project: ImplementClientScript&UIPolicy(Incident)

Date	30/09/2026
Team ID	6ab4ddb0fc666a751b566e9
Project Name	Implement Client Script & UI Policy(Incident)

Project Overview

The project, titled `ImplementClientScript&UIPolicy(Incident)`, is a ServiceNow Incident Management solution designed to improve data accuracy, consistency, and controlled user interaction on Incident records. The implementation combines a `UIPolicy`, `UIPolicy Actions`, and client-side scripts to apply conditional field behavior and validation.

Objective

The objective of the project is to demonstrate how ServiceNow client-side controls can enforce data integrity on Incident records. The solution is intended to make selected fields conditionally mandatory, automate Urgency updates, validate records during submission, and prevent direct State changes through list editing.

Problem Statement

Incident records can become incomplete, inconsistent, or incorrect when users rely only on manual checks. High Impact incidents may lack appropriate assignment information, Urgency may not reflect the selected Impact, and users may make State changes directly through list editing. These issues can affect reporting accuracy, incident routing, tracking, and overall service quality.

Proposed Solution

The proposed solution is to use ServiceNow UI Policies and Client Scripts to enforce the required behavior at the user interface level. When Impact is High, Assignment Group is required and Urgency is controlled. The `onChange` script automatically sets Urgency to High, the `onSubmit` script validates Assigned To before saving, and the `onCellEdit` script blocks direct State changes from the Incident list.

Key Functionalities

Functionality	Implementation
Conditional field control	HighImpactUIPolicy
Mandatory Assignment Group	UIPolicyAction
Automatic Urgency update	onChangeClientScript
Urgency read-only behavior	UIPolicyAction
Assigned To submission validation	onSubmitClientScript
State list edit restriction	onCellEditClientScript
Restriction reversal	ReverseIfFalseonUIPolicy

Technical Tools and Technologies

Tool/Technology	Purpose
ServiceNow Platform	Development and configuration environment
Incident Management	Business module used for Incident records
UIPolicy	Conditional field behavior
UIPolicy Actions	Mandatory and read-only field controls
Client Scripts	Client-side automation and validation
JavaScript	Scripting language used by Client Scripts
Web Browser	Access to the ServiceNow instance

System Working

A user creates or updates an Incident through the ServiceNow Incident form. The selected Impact value determines whether the HighImpactUIPolicy is triggered. When Impact is High, Assignment Group becomes mandatory and Urgency is controlled. The onChange script updates Urgency to High. At submission time, the onSubmit script validates Assigned To. Separately, the onCellEdit script prevents direct State changes in the Incident list. When the High Impact condition is removed, the UIPolicy reverses the configured restrictions.

Advantages

- Reduces manual data-entry errors on Incident forms.
- Provides consistent field behavior based on Impact.
- Automates the Urgency update for High Impact incidents.
- Prevents specified incomplete submissions before the record is saved.
- Provides controlled editing of Incident State.
- Offers immediate feedback through client-side validation and messages.

Benefits

- Improved Incident data integrity and consistency.
- More predictable Incident prioritization and assignment behavior.
- Reduced dependence on manual checks by users.
- Clearer interaction with mandatory and read-only fields.
- A lightweight configuration approach using standard ServiceNow client-side features.

User Experience

The solution is intended for Service Desk and Incident Management users who create, assign, track, and update Incident records. The user interacts with the normal ServiceNow Incident form and list view, while the configured controls respond automatically to the user's actions. This keeps the interaction familiar while adding the required validation and field controls.

Testing Summary

The project is evaluated through mandatory enforcement, successful save, reverse condition, list-edit blocking, and form-based update tests. The expected results are that the configured rules respond correctly and consistently under each scenario. Actual Pass/Fail results should be recorded after execution in the ServiceNow instance.

Future Enhancements

The following are potential future enhancements that can extend the current solution:

- Introduce additional validation rules for other important Incident fields.
- Extend conditional controls to additional Impact, Urgency, or assignment scenarios.
- Add more user guidance and context-sensitive messages for data entry.
- Expand the solution with broader Incident workflow automation and reporting controls.

These enhancements are proposed future directions and are not part of the implemented scope described in the supplied project instructions.

Overall Outcome

The final solution demonstrates how UI Policies and Client Scripts can work together to automate field behavior, enforce validation, and control selected user interactions in ServiceNow Incident Management. The project provides a structured and practical example of improving Incident data quality through client-side configuration.

Conclusion

This final project documentation presents the complete solution in a consolidated form, covering the project purpose, problem, proposed solution, functional features, technologies, benefits, testing approach, and possible future enhancements. It serves as the final written representation of the implemented ServiceNow Incident Management configuration.
